UNIT A: LESSON 2

LEARNING TARGETS

INSTRUCTIONS FOR TEACHERS:

- Refer students to the standards and objectives.
- Review the standards and objectives with students one at a time.
- At the end of the lesson, ask students what they did in class to meet the standards.

INSTRUCTIONS FOR STUDENTS:

Listen as your teacher reviews the standards and objectives. Your teacher will call on an individual or pair to explain what they mean.

Learning Target:

I can determine the main ideas and supporting details in the article “Teens and Decision Making.”

Learning Target:

I can analyze the basic structure of a complex sentence.
ACQUIRING AND USING VOCABULARY

INSTRUCTIONS FOR TEACHERS:
- Review student instructions.
- Familiarize students with their glossary. It is located in Appendix A (Glossary; labeled “Appendix: Glossary” in the student version). Tell students to use the glossary throughout the lesson.
- Pre-teach the vocabulary selected for extended instruction, provided as word cards in Appendix B (Teacher Resources). This vocabulary is abstract and critical to understanding the text.

INSTRUCTIONS FOR STUDENTS:
Your teacher will pre-teach several key words. Use your glossary for the rest of the lesson to find meanings for words you don’t know. Words that are bolded in the text and word banks can be found in the glossary. The glossary is located in the Appendix at the end of the lesson.
THINKING LOG

INSTRUCTIONS FOR TEACHERS:
• Read the guiding question and text aloud to students, modeling appropriate pace and intonation.
• During the read-aloud, define words and phrases in context that students are unlikely to know, drawing definitions from the glossary when you can. Translations, examples, gestures, and visuals also help.
• Ask students to read the text on their own and work with a partner to answer supplementary questions.
• Ask students to use their glossary to help them with word meanings.
• Call on pairs to answer the supplementary questions.
• Discuss the guiding question(s) as a group and then have students write the answer in their student chart.

INSTRUCTIONS FOR STUDENTS:
Your teacher will ask you a guiding question that you will think about as your teacher reads the text aloud to you. As your teacher reads the text aloud, listen and follow along in your text. After the text has been read aloud, work with a partner to reread the text and answer the supplementary questions. Use your glossary to help you. Your teacher will review the answers with the class. You will then discuss the guiding question(s) with your teacher and the class. Finally, you will complete a written response to the guiding question(s).

GUIDING QUESTION:
What are processes of the brain that can help teens shape their own brain development? How can learning about the brain help teens, like you, make better choices?

TEENS AND DECISION MAKING: WHAT BRAIN SCIENCE REVEALS

FINE-TUNING THE BRAIN

Like the rest of the body, the brain needs to mature in order to reach peak performance. This process involves slow changes—strongly influenced by brain activity—that have evolved to fine-tune (or optimize) how neural impulses flow throughout the brain, allowing it to process information faster and more reliably.

Inside the brain, information travels through a network of neurons, which have thread-like fibers called axons and branch-like structures called dendrites. Dendrites bring information into the neurons, while axons take it away and pass it along to the next neuron. Thus, neurons are assembled into circuits where the far end of an axon
(its terminal) is positioned close to a dendrite. The small space between the two is called a synapse—where information is **exchanged**.

Throughout childhood and adolescence, the brain is busy **fine-tuning** itself through two key processes: myelination and **synaptic pruning**.

In myelination, axons wrap themselves in a fatty substance (myelin sheath), which works like **insulating** plastic that surrounds electrical wires. This boosts the brain's **efficiency** by increasing the speed with which a **signal** travels down the axon by 100 times. In synaptic pruning, synapses not used very often are **removed**, allowing the brain to **redirect** precious **resources** toward active synapses. This **strategic** loss of weak synapses shapes the brain and makes it more **efficient**. This important pruning **process** molds the brain in response to a person's **experiences** and activities.

This means that teens have the **potential**, through their choices and the behaviors they engage in, to **shape** their own brain development—**strengthening** some circuits and getting rid of others. This makes the type of activities teens are involved in especially important. Skill building such as many physical, learning, and creative **endeavors** not only provides stimulating **challenges**, but can **simultaneously** build strong **brain pathways**. When teens learn and repeat **appropriate** behaviors, they are helping to **shape** their brains—and their futures.

**WAIT A MINUTE!**

Learning how your brain works can help explain why sometimes you behave like you do. With this knowledge, you can be better equipped to make smart choices.

One tip to follow is to take a moment before acting. When making a decision, something as simple as stopping to think can mean the difference between a **positive** and a **negative outcome**. By waiting a minute before acting, you allow yourself to:
- consider consequences
- weigh harmful outcomes (e.g., harm to yourself or others) against short-term benefits (e.g., fitting in or feeling high)
- determine whether peer pressure is making you do something you’d otherwise not do
- get information or advice, if you need it
**SUPPLEMENTARY QUESTIONS:**

1. **When does the brain reach its peak, or best, performance?**
The brain reaches its peak performance when it is fully mature.

2. **What does the process of change and maturation help the brain do?**
The process of brain maturation helps the brain process information faster and more reliably (dependably).

3. **What are the thread-like fibers in the network of neurons called?** (Recall, or remember, what “network” means from yesterday’s lesson.)
The thread-like fibers are called axons.

4. **What are the branch-like structures called?**
The branch-like structures are called dendrites.

5. **What do dendrites do?**
Dendrites bring information into the neurons.

6. **What do axons do?**
Axons remove information from the neuron and pass the information to the next neuron.

7. **What is the small space between the axon and the dendrite called?**
The space is called a synapse.

8. **What happens in the synapse space?**
The axon and the dendrite exchange information in the synapse space.
9. What key processes are helping to fine-tune, or improve, the brain in children and adolescents (teens)?
The processes that help fine-tune the brain are myelination and synaptic pruning.

10. How does myelination work? How do you know?
In myelination, axons wrap themselves in a fatty substance. It is like wrapping plastic around electrical wires; it makes the brain work faster (slower/faster).

I know this because the text says, “This boosts the brain’s efficiency by increasing the speed with which a signal travels down the axon by 100 times.”

11. What happens during synaptic pruning?
During synaptic pruning, synapses that are no longer needed are pruned (removed).

12. How does synaptic pruning help the brain become more efficient?
The brain becomes more efficient because it can use precious resources on active synapses (the synapses we use more often).

13. These processes mold the brain. What is the brain responding to when myelination and synaptic pruning take place?
The brain is responding to a person’s experiences and activities.

14. How does this give teens the ability to shape their own brains?
Teens can choose the activities that they do often. This will strengthen the brain’s ability to do these things well.

15. What kind of activities can teens do to help them build strong pathways in their brains?
Teens can be involved in physical, learning, and creative activities to build skills and strong, positive pathways.

16. The text says, “WHAT A MINUTE!” Does this mean we need to take a one minute break now?
No, this phrase is an idiom. These words mean something different than what they say. They mean, “let’s stop and think about this.”

17. Think about lesson 1. What is another way learning about the brain can help you?
Learning about the brain can help explain how you behave, or act, so you can make better choices.
18. What one simple tip does the author recommend, or suggest?
The author recommends that you stop and think before you make a decision.

19. What can this mean for you?
It can mean the difference between positive and negative outcomes.

20. What four things can you do if you wait a minute before acting?
   • You can consider consequences.
   • You can think about whether your decision will harm, or hurt, you or others. At the same time, you can think about whether the short-term benefits are worth it (like fitting in or feeling high).
   • You can decide whether peer pressure is making you do something that you normally wouldn’t do.
   • You can get information or advice before acting.

RESPONSE TO GUIDING QUESTION(S):
What are processes of the brain that can help teens shape their own brain development? How can learning about the brain help teens, like you, make better choices?
Suggested Response: Myelination and synaptic pruning are key processes that can help teens shape their own brain development. Learning about the brain can help teens, like me, choose to be involved in activities that build strong and positive pathways in the brain. In addition, knowing that the teen brain is not yet mature helps me understand that taking time to think about my decisions will lead to more positive outcomes.
NEUROLOGIST NOTEBOOK

**INSTRUCTIONS FOR TEACHERS:**
- Review student instructions.

**INSTRUCTIONS FOR STUDENTS:**
Work with a partner. Use your neurologist notebook to write down key, or important, information from the text. You will write down main ideas and some details, or specific information, about each main idea. You can use information from your Thinking Log. Some information is already filled in for you.

**WORD BANK:**
adults, axons, brains, dendrites, faster, feelings, logic, mature, myelin, neurons, pathways, positive, shape, slower, smart, synaptic pruning, teens, think

**Summary from yesterday:**
Teens make decisions differently than adults because their brains are different. Teens are more likely to make decisions based on feelings instead of logic.

**Brief background:**
Information in the brain travels through neurons, which have axons and dendrites. Neurons can become more efficient, or faster, at moving information through two processes. First, they can cover themselves in myelin. Second, the brain can use synaptic pruning to remove, or get rid of, the slower neurons.

<table>
<thead>
<tr>
<th>Main idea:</th>
<th>Supporting details:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Teens can shape their brains through positive activities.</td>
<td>As brains mature, activities reinforce, or strengthen, brain pathways.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Main idea:</th>
<th>Supporting details:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Teens can make smart choices by stopping to think.</td>
<td>Stopping to think gives you time to choose a positive outcome.</td>
</tr>
</tbody>
</table>

**Conclusion:**
Teens can influence, or affect, how their brains mature, or develop. They can strengthen brain pathways connected with positive activities.
FUNCTIONAL ANALYSIS

INSTRUCTIONS FOR TEACHERS:
• Review student instructions for functional analysis with the whole class.
• Complete the functional analysis with the whole class.
• Have students work with a partner to rewrite the sentence in their own words.

INSTRUCTIONS FOR STUDENTS:
Work with your class to analyze an important sentence(s) from the text.
• Every sentence has someone or something that does something. First you determine this who or what.
• Every sentence has something that they do or did. Figure that part out next. Now you have the most important parts of the sentence in place.
• Then you will figure out what they did the action to or for.
• Finally, you will write the descriptive details.
• Write your answers in the spaces below.
• When you are done, write the sentence again in your own words.
You may want to use definitions from the glossed text in the sections above.

Functional Analysis:
Learning how your brain works can help explain why sometimes you behave like you do.

Who or What: Learning

DESCRIPTOR (What): how your brain works

What Happened (Action): can help explain

What: why sometimes you behave

DESCRIPTOR (How): like you do

What the sentence says:

My own words:

Learning

Learning

how your brain works

how ______________________________

can help explain

can help _______________________

why sometimes you behave

why you _______________________

like you do

like _______________________

Write the sentence in your own words and then explain it to your partner.

EXIT TICKET

INSTRUCTIONS FOR TEACHERS:
• Review student instructions with the whole class.

INSTRUCTIONS FOR STUDENTS:
This graphic organizer will help you keep track of information about the brain for all of the readings. Each day you will write down new information from each reading.
• First, write information about how the whole brain matures, or develops, as you get older.
• Next, provide, or write, information you are learning about processes in the brain: synaptic pruning, myelination, and decision making.
• Then write what you learned about how teens can influence, or affect, brain development (so what?).

WORD BANK: efficient, myelin, neurons, pathways, positive, slower, stop, think

<table>
<thead>
<tr>
<th>Information about how the brain develops</th>
<th>Synaptic pruning</th>
<th>Myelination</th>
<th>Decision Making</th>
<th>So what?</th>
</tr>
</thead>
<tbody>
<tr>
<td>You can strengthen brain pathways through positive activities.</td>
<td>Synaptic pruning removes neurons that are not used as much, or that are slower.</td>
<td>Neurons become more efficient when they are covered in myelin.</td>
<td>Teens can make better decisions when they stop to think.</td>
<td>[Write what you learned about influencing brain development:]</td>

*Vocabulary from the Expeditionary Learning lessons.
Italicized words are from the Academic Word List.
Appendix B: Teacher Resources

1. Recall, or remember, from the last lesson when we talked about neurons. Neurons are cells in your brain. The first picture shows a neuron.

2. Neurons have two main parts. You can see these parts in the second picture. They are the dendrite, which is the branching end of the neuron; and the axon, which is the long stem. The axon is covered in myelin, which protects the axon, or keeps it safe.

3. Partner talk: Look at the first picture. Point to the dendrite. Point to the axon. Where is the myelin?
