WHAT ARE SOME IMPORTANT PROPERTIES OF SOILS?

Key ideas are identified by numbers (1). Performance indicators are identified by bullets (•). Sample tasks are identified by triangles (▲).
Students will understand the relationships and common themes that connect mathematics, science, and technology and apply the themes to these and other areas of learning.

Magnitude and Scale

3. The grouping of magnitudes of size, time, frequency, and pressures or other units of measurement into a series of relative order provides a useful way to deal with the immense range and the changes in scale that affect the behavior and design of systems.

Students:
- provide examples of natural and manufactured things that belong to the same category yet have very different sizes, weights, ages, speeds, and other measurements.
- identify the biggest and the smallest values as well as the average value of a system when given information about its characteristics and behavior.

This is evident, for example, when students:
- compare the weight of small and large animals.
- compare the speed of bicycles, cars, and planes.
- compare the life spans of insects and trees.
- collect and analyze data related to the height of the students in their class, identifying the tallest, the shortest, and the average height.
- compare the annual temperature range of their locality.

Equilibrium and Stability

4. Equilibrium is a state of stability due either to a lack of changes (static equilibrium) or a balance between opposing forces (dynamic equilibrium).

Students:
- cite examples of systems in which some features stay the same while other features change.
- distinguish between reasons for stability—from lack of changes to changes that counterbalance one another to changes within cycles.

This is evident, for example, when students:
- record their body temperatures in different weather conditions and observe that the temperature of a healthy human being stays almost constant even though the external temperature changes.
- identify the reasons for the changing amount of fresh water in a reservoir and determine how a constant supply is maintained.

Sample Problem/Activity

What can I learn about my body?

- How do your results compare to your classmates' results?
- What factors do you think could account for the differences?
- Who would benefit from the information you gathered and how?
- What other information do you think would complete your knowledge of your body?
- Are there some data on your form that you would rather keep confidential? Which data?
- Who should and should not have access to this information? Give reasons for your answers.

CONTENT UNDERSTANDINGS
- Soil consists of weathered rock fragments that contain organic material
### Patterns of Change

5. Identifying patterns of change is necessary for making predictions about future behavior and conditions.

**Students:**
- Use simple instruments to measure such quantities as distance, size, and weight and look for patterns in the data.
- Analyze data by making tables and graphs and looking for patterns of change.

This is evident, for example, when students:
- Compare shoe size with the height of people to determine if there is a trend.
- Collect data on the speed of balls rolling down ramps of different slopes and determine the relationship between speed and steepness of the ramp.
- Take data they have collected and generate tables and graphs to begin the search for patterns of change.

### Optimization

6. In order to arrive at the best solution that meets criteria within constraints, it is often necessary to make trade-offs.

**Students:**
- Determine the criteria and constraints of a simple decision making problem.
- Use simple quantitative methods, such as ratios, to compare costs to benefits of a decision problem.

This is evident, for example, when students:
- Describe the criteria (e.g., size, color, model) and constraints (e.g., budget) used to select the best bicycle to buy.
- Compare the cost of cereal to number of servings to figure out the best buy.

---

### Sample Problem/Activity

Ask each student to measure the length of the head and the height of three adults and three children (two years old or younger) as an outside assignment. Show them how to calculate the ratio of head length to height. With the class, calculate the average ratio for the children and for the adults.

- How does the average ratio for the children compare to that for the adults?
- How can we describe in words the change in ratios?
- What does this tell us about human growth and development?
Students will understand the relationships and common themes that connect mathematics, science, and technology and apply the themes to these and other areas of learning.

Sample Problem/Activity

Why would I need an owner's manual?

Students will be able to describe similarities and differences between a manual they create for a device and a personal manual they will create throughout the course of this module and perhaps beyond.

Interdisciplinary Connections

These activities focus on devices as technologies:
- Technology: Compare electronics information about several types of devices, and account for their similarities and differences.
- Social Studies: Talk to a lawyer, paralegal, or representative of the Better Business Bureau about written and implied warranties.
- Language Arts: Develop a second version of your manual that contains a limited number of technical words. Consult your language arts teacher, a children's writer, or a technical writer for assistance in using this kind of controlled approach to manual writing.
- Mathematics: Locate and read selected magazine articles to determine the nature and extent of the market in various devices. Prepare graphs and charts that show relative percentages of kinds of goods sold and other pertinent information.
- Health: Interview a nurse, audiologist, pediatrician, or other health specialist regarding hearing losses associated with one or more entertainment devices.
- Home and Career Skills: Conduct a survey of the electronic devices in your home, including entertainment and nonentertainment devices. Compare your results with an informal survey of one or more older persons regarding electronic devices used in a typical home in the early sixties.
- Foreign Languages and Cultures: Look through a number of owners' manuals at home or at a car dealership or electronics store. Note whether these manuals are written only in English or in other languages as well. Try to explain why the manufacturer chose certain languages.
1. Through systems thinking, people can recognize the commonalities that exist among all systems and how parts of a system interrelate and combine to perform specific functions.

Students:
- describe the differences between dynamic systems and organizational systems.
- describe the differences and similarities between engineering systems, natural systems, and social systems.
- describe the differences between open- and closed-loop systems.
- describe how the output from one part of a system (which can include material, energy, or information) can become the input to other parts.

This is evident, for example, when students:
▲ compare systems with internal control (e.g., homeostasis in organisms or an ecological system) to systems of related components without internal control (e.g., the Dewey decimal, solar system).

2. Models are simplified representations of objects, structures, or systems used in analysis, explanation, interpretation, or design.

Students:
- select an appropriate model to begin the search for answers or solutions to a question or problem.
- use models to study processes that cannot be studied directly (e.g., when the real process is too slow, too fast, or too dangerous for direct observation).
- demonstrate the effectiveness of different models to represent the same thing and the same model to represent different things.

This is evident, for example, when students:
▲ choose a mathematical model to predict the distance a car will travel at a given speed in a given time.
▲ use a computer simulation to observe the process of growing vegetables or to test the performance of cars.
▲ compare the relative merits of using a flat map or a globe to model where places are situated on Earth.
▲ use blueprints or scale models to represent room plans.
Students will understand the relationships and common themes that connect mathematics, science, and technology and apply the themes to these and other areas of learning.

**Magnitude and Scale**

3. The grouping of magnitudes of size, time, frequency, and pressures or other units of measurement into a series of relative order provides a useful way to deal with the immense range and the changes in scale that affect the behavior and design of systems.

Students:
- cite examples of how different aspects of natural and designed systems change at different rates with changes in scale.
- use powers of ten notation to represent very small and very large numbers.

This is evident, for example, when students:
- ▲ demonstrate that a large container of hot water (more volume) cools off more slowly than a small container (less volume).
- ▲ compare the very low frequencies (60 Hertz AC or $6 \times 10$ Hertz) to the mid-range frequencies (10 Hertz-FM radio) to the higher frequencies ($10^{15}$ Hertz) of the electromagnetic spectrum.

**Equilibrium and Stability**

4. Equilibrium is a state of stability due either to a lack of changes (static equilibrium) or a balance between opposing forces (dynamic equilibrium).

Students:
- describe how feedback mechanisms are used in both designed and natural systems to keep changes within desired limits.
- describe changes within equilibrium cycles in terms of frequency or cycle length and determine the highest and lowest values and when they occur.

This is evident, for example, when students:
- ▲ compare the feedback mechanisms used to keep a house at a constant temperature to those used by the human body to maintain a constant temperature.
- ▲ analyze the data for the number of hours of sunlight from the shortest day to the longest day of the year.

**Sample Problem/Activity**

[Diagram of Light Water Reactor (Boiling Water Type)]
HOW MANY IS ENOUGH?

Students will be able to use a simple model to illustrate resource depletion and will be able to suggest variations to the model which would allow management of population size for a wildlife species.

Evaluation
Students are able to identify factors that influence population size, and they suggest reasons why unlimited killing of wild creatures by humans has more of a long-term effect on some species than on others.

Classroom Activity
1. Form student groups of four or five. Display a container more than half full of paper clips. Tell students that each clip represents an individual of one kind of bird and that all the clips in this container represent a wild bird population (i.e., all are of the same species).

The container represents the habitat for the population. Also display a similar container less than half full of the same size, but a different color, of paper clip. Explain that each of the clips in this container represents one individual of another population (i.e., a different species) of wild birds. Finish introducing the bird game (see Procedural Notes section) and have students play the game.

Key ideas are identified by numbers (1). Performance indicators are identified by bullets (*). Sample tasks are identified by triangles (▲).
What is a resistor and how can it be used?

In Series

In Parallel

These activities focus on resistors:

► Technology: Carefully open one or more unplugged electronic devices around your house, and list the various types of resistors employed in the different devices. (You may use schematics to describe the types of resistors instead of naming the types.) Calculate an average value of a typical resistor in a domestic appliance.

► Social Studies: Research the invention of the resistor and ways in which its use has expanded over time. / Explore patent law as it would relate to the discovery of a new type of resistor.

► Language Arts: Write a play which chronicles the life history of a resistor from the creation of its original constituent materials to the end of its useful life.

► Mathematics: Create a computer program that will calculate the overall resistance for a particular circuit when different types of resistors are employed. / Calculate the resistance of one of the circuits used in this activity if several different values of resistors are utilized within the circuit.

► Health: Write to Underwriters Laboratories to find out about their work testing electrical devices in the interest of consumer safety.

► Home and Career Skills: Conduct a mini-family workshop in which you explain to members of your household the use of resistors. / Investigate careers in electronics.

► Arts: Produce a small flip-chart presentation of the movement of electrons within a circuit in which two resistors reside, so that when the booklet is flipped with the fingers, the electrons appear to move through the circuit. Alternatively, create a set of overhead transparencies that your teacher can use to demonstrate this phenomenon.

► Foreign Languages and Cultures: Research periodical literature to find out which nations are the leading producers of resistors.
1. Through systems thinking, people can recognize the commonalities that exist among all systems and how parts of a system interrelate and combine to perform specific functions.

Students:
• explain how positive feedback and negative feedback have opposite effects on system outputs.
• use an input-process-output-feedback diagram to model and compare the behavior of natural and engineered systems.
• define boundary conditions when doing systems analysis to determine what influences a system and how it behaves.

This is evident, for example, when students:
▲ describe how negative feedback is used to control loudness automatically in a stereo system and how positive feedback from loudspeaker to microphone results in louder and louder squeals.

2. Models are simplified representations of objects, structures, or systems used in analysis, explanation, interpretation, or design.

Students:
• revise a model to create a more complete or improved representation of the system.
• collect information about the behavior of a system and use modeling tools to represent the operation of the system.
• find and use mathematical models that behave in the same manner as the processes under investigation.
• compare predictions to actual observations using test models.

This is evident, for example, when students:
▲ add new parameters to an existing spreadsheet model.
▲ incorporate new design features in a CAD drawing.
▲ use computer simulation software to create a model of a system under stress, such as a city or an ecosystem.
▲ design and construct a prototype to test the performance of a temperature control system.
▲ use mathematical models for scientific laws, such as Hooke’s Law or Newton’s Laws, and relate them to the function of technological systems, such as an automotive suspension system.
▲ use sinusoidal functions to study systems that exhibit periodic behavior.
▲ compare actual populations of animals to the numbers predicted by predator/prey computer simulations.
Caution: Do not touch the lamps since it may become very hot. Do not look directly at the lamp. Do not leave the lamp unattended.

Observing the Greenhouse Effect

Directions: Follow the steps below and complete the experiment. Place all information that you gather on the data table on Worksheet C. Then graph your results and answer the questions.

1. Place soil to a depth of 2 cm in each of the shoeboxes. Thoroughly moisten the soil with water, but not so much that water sits on top of the soil.
2. Cut out a piece of cardboard so that when it is inserted into one of the clear plastic shoeboxes it will divide the box in half and will be only about three-fourths the height of the box (Diagram 1). Construct a similar cardboard divider for the other box.
3. Insert a cardboard divider into each shoebox.
4. Lean a thermometer (with the bulb end up) against each divider (Diagram 2).
5. Set the boxes side by side and about 2 cm apart under the flood lamp. Adjust the flood lamp so that it is about 25 cm above and equally distant from each box (Diagram 3). Place a clear plastic cover on one box.
6. When the temperatures of the thermometers stop changing, record them in the appropriate spaces of the “0 minutes” row of the data table on Worksheet C.
7. Turn on the light. Record in the data table the temperature of each thermometer every 30 seconds for 15 minutes. Then turn off the light.

Standard 6—Interconnectedness: Common Themes

Patterns of Change

5. Identifying patterns of change is necessary for making predictions about future behavior and conditions.

Students:
- use sophisticated mathematical models, such as graphs and equations of various algebraic or trigonometric functions.
- search for multiple trends when analyzing data for patterns, and identify data that do not fit the trends.

This is evident, for example, when students:
▲ use a sine pattern to model the property of a sound or electromagnetic wave.
▲ use graphs or equations to model exponential growth of money or populations.
▲ explore historical data to determine whether the growth of a parameter is linear or exponential or both.

Optimization

6. In order to arrive at the best solution that meets criteria within constraints, it is often necessary to make trade-offs.

Students:
- use optimization techniques, such as linear programming, to determine optimum solutions to problems that can be solved using quantitative methods.
- analyze subjective decision making problems to explain the trade-offs that can be made to arrive at the best solution.

This is evident, for example, when students:
▲ use linear programming to figure the optimum diet for farm animals.
▲ evaluate alternative proposals for providing people with more access to mass transportation systems.

Sample Problem/Activity

Key ideas are identified by numbers (1).
Performance indicators are identified by bullets (*).
Sample tasks are identified by triangles (▲).
Classroom Activity

1. Ask students to describe to one another in small groups what the word “composting” means. See if each group can develop a definition acceptable to all members of the group. Share these definitions with the entire class.
   - Does anyone’s family, relatives, or neighbors compost?
   - What are the advantages and disadvantages of composting?
   - What actually goes on within material to cause it to turn to compost? How do you know?
   - Could the items in the bags used in Activity 1.2 become compost? Why or why not?
   - Does composting occur in nature without human intervention? How can we verify this?

2. Help students plan a natural decomposition field investigation such as a comparison of two logs in a local woodland—one decomposing and the other with no visible signs of decomposition. Students should develop a common observation sheet to use in their investigations, as well as a systematic set of procedures to obtain samples from different locations for further study.

3. Take students to a local woodland or wet area. Have them take notes on evidence of active decomposition within the area. They should remove for study small samples of various materials (both decomposing and nondecomposed), using the procedures they developed.
