	*Note Each performance objective in this module is written without specifi	c
24	reference to criteria for evaluation. The minimum performance level left to the discretion of the individual instructor, due to the dive	is
25	of the student population to be served (low achievers, average, high	
26	achievers, special) and the range in grade level for this offering.	

JOB NO. PAGE NO. ALIGN FIRST CHARACTER UNDER THIS ARROW 6 LINES INCH INSTRUCTIONS (NOTES) GENERAL INSTRUCTIONAL STRATEGIES R The writers of this curriculum offer specific instructional strategies 2 in the section to follow but it can appear somewhat fragmented without a description of the general strategy for this module. This section on 3 General Instructional Strategies is included to communicate the nature of the module in a more cohesive form. 4 The overall strategy is to have the students research and develop a 5 product, or possibly a process, and take that development to a trial-run stage. Jigs and fixtures would most likely be developed. The students 6 would not run many products (if products and not a process was chosen), but they would get to see a few trial pieces produced. 7 The instructor might choose to dovetail this module with the one 8 entitled "Production: Manufacturing". The students in the "Production Research and Development" module (20 weeks) could develop possible produc-9 tion runsfor the "Production: Manufacturing" module (10 weeks). Certainly, in 10 weeks the students in the latter course could not have the time to 10 fully develop a product, so the two courses could be used by the instructor as a combination, in terms of teacher preparation. 11 Some other general strategies would include: 12 Field trips. If there is an appropriate research and development 1. 13 facility in the area, many objectives could be covered by a field trip. 14 Guest speaker. If field trips are not feasible, it is highly 2. recommended that an attempt be made to locate a suitable quest speaker. 15 Many of the inputs to R&D could be covered with the use of a quest speaker. 16 35mm slides. At the very least, if field trips and guest speakers 3. are not probable, the instructor should visit an R&D facility and take slides 17 18 Written responses from the students. Some of the objectives might 4. best be covered by written responses by the students. It is recommended 19 that these be assigned as homework so the maximum amount of laboratory time can be spent on research and development activities. 20 Research vs. development. It is defined in this module that 5. 21 research is the generation of new knowledge and development is putting that knowledge to work. It is recognized that not every situation will be able 22 to have every student involved in both. It is further recognized that some of the procedures used in research are often used in development as well. 23 It is left to the discretion of the instructor to cover these two concepts as appropriate for the individual situation and the individual problems 24 produced by the students. 25 26 antan a sa

(NOTES)	2.2.2.1.a.Have the class vote on which of several models and 15 prototypes that were developed they would like to see as a class
2	project. The entire class would get involved in the engineering of the production line for this project. Have each student develop a
3	flowchart of the production process.
4	2.2.2.2.a.Assign one group of students to set up the equipment for the trial production run.
5	2.2.2.3.a. Have another group of students design the necessary tooling for
6	the trial production run. b.A tool and die maker could address the class to discuss the importance of proper tooling. Jigs and fixtures used in a nearby
7	manufacturing facility could be examined by the class.
8	2.2.2.4.a.Have one student in charge of personnel utilization and reassign- ment.
10	b.Write up a detailed job description/operations card for each station/operation on the product line.
11	2.2.2.5.a.One or more students could be involved in material procurement,
12	as needed. b. Develop a master list of needed materials for class inspection.
13	Assign to all students the task of seeking out sources of materials. All findings along with price, quality, etc., will be reported to the group for further investigation.
14	2.2.4 c a final state and state and state for each method of the
15	2.2.2.6.a.Conduct a trial run and produce one product for each member of the class. b.Do a teaching "walk through" of each production job; with an on-
16	the-spot analysis for safety efficiency, before conducting a trial run of line.
17 18	2.2.2.7.a.The class could be involved in a group discussion whenever de- bugging is required to brainstorm possible solutions.
19	3.1.1.a. Have the students make a list for homework of ten products that
<sup>.</sup> 20	have improved due to research and development. b. Give a writing assignment to each student in which a critical review is made of the produced product and improvements that could
21	be made if done again. c. Students will develop a list of products that have been improved
22	over the past ten years. d. The instructor will identify a product. The students will develop
23	a time line which illustrates the approximate dates of the intro- duction of the product and subsequent improvements that have been
24	facilitated through research and development. e. Keep a notebook/bulletin board section for the collection of "new
25	products". Individual reports to class on product innovation of particular interest to student.
