#### 3. Inheritance and Variation of Traits: Life Cycles and Traits

Students who demonstrate understanding can:

- 3-LS1-1. Develop models to describe that organisms have unique and diverse life cycles but all have in common birth, growth, reproduction, and death. [Clarification Statement: Changes organisms go through during their life form a pattern.] [Assessment Boundary: Assessment of plant life cycles is limited to those of flowering plants. Assessment does not include details of human reproduction.]
- **3-LS3-1.** Analyze and interpret data to provide evidence that plants and animals have traits inherited from parents and that variation of these traits exists in a group of similar organisms. [Clarification Statement: Patterns are the similarities and differences in traits shared between offspring and their parents, or among siblings. Emphasis is on organisms other than humans.] [Assessment Boundary: Assessment does not include genetic mechanisms of inheritance and prediction of traits. Assessment is limited to non-human examples.]
- 3-LS3-2. Use evidence to support the explanation that traits can be influenced by the environment. [Clarification Statement: Examples of the environment affecting a trait could include normally tall plants grown with insufficient water are stunted; and, a pet dog that is given too much food and little exercise may become overweight.]
- 3-LS4-2. Use evidence to construct an explanation for how the variations in characteristics among individuals of the same species may provide advantages in surviving, finding mates, and reproducing. [Clarification Statement: Examples of cause and effect relationships could include plants that have larger thorns than other plants may be less likely to be eaten by predators; and, animals that have better camouflage coloration than other animals may be more likely to survive and therefore more likely to produce offspring.]
   The performance expectations above were developed using the following elements from the NRC document *A Framework for K-12 Science Education*:

#### MS. Structure and Properties of Matter

MS. Structure and Properties of Matter			
MS. Structure and Properties of Matter           Students who demonstrate understanding can:         MS-PS1-1. Develop models to describe the atomic composition of simple molecules and extended structures. [Clarification Statement: Emphasis is on developing models of molecules that vary in complexity. Examples of simple molecules could include ammonia and methanol. Examples of extended structures could include sodium chloride or diamonds. Examples of particulate-level models could include drawings 3D ball and stick structures, or computer representations showing different substances with different types of atoms.] [Assessment Boundary: Assessment does not include valence electrons and bonding energy, discussing the individual ions composing complex structures, or a complete depiction of all individual atoms in a complex molecule or extended structure.]           MS-PS1-3. Gather and make sense of information to describe that synthetic materials come from natural resources and impact society. [Clarification Statement: Emphasis is on natural resources that undergo a chemical process to form the synthetic material. Examples of new materials could include new medicine, foods, and alternative fuels.] [Assessment Boundary: Assessment is limited to the qualitative interpretation of evidence provided.]           MS-PS1-4. Develop a model that predicts and describes changes in particle motion, temperature, and phase (state) of a substance when thermal energy is added or removed. [Clarification Statement: Emphasis is on qualitative particulate- level models of solids, liquids, and gases to show that adding or removing thermal energy increases of particles could include ions, molecules, or atoms. Examples of substance to ullustrate that density is a property that can be used to identify samples of matter.			
The performance expectations above were	developed using the following elements from the NRC document A	Framework for K-12 Science Education.	
<ul> <li>Science and Engineering Practices</li> <li>Developing and Using Models</li> <li>Modeling in 6–8 builds on K–5 and progresses to developing, using and revising models to describe, test, and predict more abstract phenomena and design systems.</li> <li>Develop a model to predict and/or describe phenomena. (MS-PS1-1).(MS-PS1-4)</li> <li>Planning and Carrying Out Investigations Planning and carrying out investigations to answer questions or est solutions to problems in 6–8 builds on (&lt;-5 experiences and progresses to include investigations hat use <u>multiple variables</u> and provide evidence to support explanations or design solutions.</li> <li>Plan an investigation individually and collaboratively, and in the design: identify independent and dependent variables and controls, what tools are needed to do the gathering, how measurements will be recorded, and how many data are needed to support a claim. (MS-PS1-8)</li> <li>Collect data to produce data to serve as the basis for evidence to answer scientific questions or test design solutions under a range of conditions. (MS-PS1-8)</li> <li>Engaging in Argument from Evidence ingaging in argument from Evidence</li> <li>Engaging in Argument from Evidence to anvincing argument that supports or refutes claims for either explanations or solutions about the natural and designed world.</li> <li>Construct and present oral and written arguments supported by empirical evidence and scientific reasoning to support or refute an explanation or a model for a phenomenon or a solution to a problem. (MS-PS1-7)</li> <li>Detaining, Evaluating, and communicating information in 6–8 builds on K–5 and progresses to evaluating the merit and validity of ideas and methods.</li> <li>Gather, read, and synthesize information from multiple appropriate sources and assess the credibility, accuracy, and possible bias of each publication and methods used, and describe how they are supported or not supported by evidence. (MS-PS1-3)</li> </ul>	<ul> <li>Disciplinary Core I deas</li> <li>PS1.A: Structure and Properties of Matter         <ul> <li>(NYSED) Substances are made of one type of atom or combinations of different types of atoms. Individual atoms are particles and can combine to form larger particles that range in size from two to thousands of atoms. (MS-PS1-1)</li> <li>(NYSED) Each substance has characteristic physical and chemical properties (for any bulk quantity under given conditions) that can be used to identify it. (MS-PS1-3), (MS-PS1-7) (Note: This Disciplinary Core Idea is also addressed by MS-PS1-2.)</li> <li>(NYSED) In a solid, the particles are closely spaced and vibrate in position but do not change their relative locations. In a liquid, the particles are closely spaced but are able to change their relative locations. In a gas, the particles are widely spaced except when they happen to collide and constantly change their relative locations. (MS-PS1-4)</li> </ul> </li> <li>Solids may be formed from molecules, or they may be extended structures with repeating subunits (e.g., crystals). (MS-PS1-1)</li> <li>(NYSED) The changes of state that occur with variations in temperature and/or pressure can be described and predicted using these models of matter. (MS-PS1-4)</li> <li>(NYSED) Mixtures are physical combinations of one or more samples of matter and can be separated by physical means. (MS-PS1-8)</li> <li>PS1.B: Chemical Reactions</li> <li>(NYSED) Substances react chemically in characteristic ways. In a chemical process, the atoms that make up the original substances are regrouped into different particles, and these new substances have different properties from those of the reactants. (MS-PS1-2) and MS-PS1-5.)</li> <li>PS3.A: Definitions of Energy</li> <li>(NYSED) The term "heat" as used in everyday language refers both to thermal energy (the motion of particles within a substance) and the transfer of that thermal energy from one object to another. In sc</li></ul>	<ul> <li>Crosscutting Concepts</li> <li>Patterns</li> <li>Macroscopic patterns are related to the nature of microscopic and atomic-level structure. (MS-PS1-1), (MS-PS1-7), (MS-PS1-8)</li> <li>Graphs, charts, and images can be used to identify patterns in data. (MS-PS1-1), (MS-PS1-4)</li> <li>Cause and Effect</li> <li>Cause and effect relationships may be used to predict phenomena in natural or designed systems. (MS-PS1-4)</li> <li>Scale, Proportion, and Quantity</li> <li>Time, space, and energy phenomena can be observed at various scales using models to study systems that are too large or too small. (MS-PS1-1)</li> <li>Structure and Function</li> <li>Structures can be designed to serve particular functions by taking into account properties of different materials, and how materials can be shaped and used. (MS-PS1-3)</li> <li>Connections to Engineering, Technology and Applications of Science</li> <li>Interdependence of Science, Engineering, and Technology</li> <li>Engineering advances have led to important discoveries in virtually every field of science, and scientific discoveries have led to the development of entire industries and engineered systems. (MS-PS1-3)</li> <li>Influence of Science, Engineering and Technology on Society and the Natural World</li> <li>The uses of technologies and any limitations on their use are driven by individual or societal needs, desires, and values; by the findings of scientific research; and by differences in such factors as climate, natural resources, and economic conditions. Thus technology use varies from region to region and over time. (MS-</li> </ul>

### MS. Structure, Function and Information Processing MS-LS1-1. Plan and conduct an investigation to provide evidence that living things are made of cells; either one cell or many different numbers and types of cells. [Clarification Statement: Emphasis is on developing evidence that living things are made of cells, distinguishing between living and non-living things, and understanding that living things may be made of one cell or many and varied cells.1 MS-LS1-2. Develop and use a model to describe the function of a cell as a whole and ways parts of cells contribute to the function. [Clarification Statement: Emphasis is on the cell functioning as a whole system and the primary role of identified parts of the cell, specifically the nucleus, chloroplasts, mitochondria, cell membrane, and cell wall.] [Assessment Boundary: Assessment of organelle structure/function relationships is limited to the cell wall and cell membrane. Assessment of the function of the other organelles is limited to their relationship to the whole cell. Assessment does not include the biochemical details related to the functions of cells or cell parts.] MS-LS1-3. Construct an explanation supported by evidence for how the body is composed of interacting systems consisting of cells, tissues, and organs working together to maintain homeostasis. [Clarification Statement: Emphasis should be on the function and interactions of the major body systems (e.g. circulatory, respiratory, nervous, musculoskeletal).] [Assessment Boundary: Assessment is focused on the interactions between systems not on the functions of individual systems.] MS-LS1-8. Gather and synthesize information that sensory receptors respond to stimuli, resulting in immediate behavior and/or storage as memories. [Assessment Boundary: Assessment does not include mechanisms for the transmission of this information.] The performance expectations above were developed using the following elements from the NRC document A Framework for K-12 Science Education: Science and Engineering Practices Disciplinary Core Ideas **Crosscutting Concepts** LS1.A: Structure and Function **Cause and Effect Developing and Using Models** All living things are made up of cells, Cause and effect relationships may be used to Modeling in 6-8 builds on K-5 and progresses to developing, which is the smallest unit that can be predict phenomena in natural systems. ### MS. Matter and Energy in Organisms and Ecosystems

Students who demonstrate understanding can: MS-LS1-6. Construct a scientific explanation based on evidence for the role of photosynthesis in the cycling of matter and flow of energy into and out of organisms. [Clarification Statement: Emphasis is on tracing movement of matter and flow of energy.] [Assessment Boundary: Assessment does not include the biochemical mechanisms of photosynthesis.] MS-LS1-7. Develop a model to describe how food molecules are rearranged through chemical reactions to release energy during cellular respiration and/or form new molecules that support growth as this matter moves through an organism. [Clarification Statement: Emphasis is on describing that molecules are broken apart and put back together and that in this process, energy is released.] [Assessment Boundary: Assessment does not include details of the chemical reactions for respiration or synthesis.] MS-LS2-1. Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem. [Clarification Statement: Emphasis is on cause and effect relationships between resources and growth of individual organisms and the numbers of organisms in ecosystems during periods of abundant and scarce resources.] MS-LS2-3. Develop a model to describe the cycling of matter and flow of energy among living and nonliving parts of an ecosystem. [Clarification Statement: Emphasis is on describing the conservation of matter and flow of energy associated with ecosystem, and on defining the boundaries of the ecosystem.] [Assessment Boundary: Assessment does not include the use of chemical reactions to describe the processes.] MS-LS2-4. Construct an argument supported by empirical evidence that changes to physical or biological components of an ecosystem affect populations. [Clarification Statement: Emphasis is on recognizing patterns in data and making warranted inferences about shifts in populations due to changes in the ecosystem.] The performance expectations above were developed using the following elements from the NRC document A Framework for K-12 Science Education: Science and Engineering Practices Disciplinary Core Idea Crosscutting Concepts LS1.C: Organization for Matter and Energy Flow in Organisms Cause and Effect **Developing and Using Models** Plants, algae (including phytoplankton), and many Cause and effect Modeling in 6–8 builds on K–5 experiences and microorganisms use the energy from light to make sugars (food) relationships may be used progresses to developing, using, and revising models to from carbon dioxide from the atmosphere and water through the to predict phenomena in describe, test, and predict more abstract phenomena process of photosynthesis, which also releases oxygen. These natural or designed and design systems. sugars can be used immediately or stored for growth or later use. systems. (MS-LS2-1) • Develop a model to describe phenomena. (MS-LS2-3) (MS-LS1-6) Energy and Matter Develop a model to describe unobservable Within individual organisms, food moves through a series of Matter is conserved mechanisms. New York State Next	Generation Learning Standards Connections:
ELA/Literacy –	
6-8.RST.1	Cite specific textual evidence to support analysis of science and technical texts, charts, graphs, diagrams, etc. Understand and follow a detailed
	set of directions. (MS-LS1-4),(MS-LS1-5),(MS-LS3-1),(MS-LS3-2),(MS-LS4-5)
6-8.RST.2	Determine the central ideas or conclusions of a source; provide an accurate, objective summary of the source distinct from prior knowledge or
	opinion. (MS-LS1-5)
6-8.RST.4	Determine the meaning of symbols, key terms, and other content-specific words and phrases as they are used in scientific or technical sources.
	(MS-LS3-1),(MS-LS3-2)
6-8.RST.7	Identify and match scientific or technical information present as text with a version of that information presented visually (e.g., in a flowchart,
	diagram, model, graph, or table). (MS-LS3-1),(MS-LS3-2)
6.R.8	Trace and evaluate the development of an argument and specific claims in a text, distinguishing claims that are supported by reasons and
	relevant evidence from the claims that are not. (MS-LS1-4)
6-8.WHST.1	Write arguments focused on discipline content. (MS-LS1-4)
6-8.WHST.2	Write informative/explanatory text focused on discipline-specific content. (MS-LS1-5)
6-8.WHST.8	Gather relevant information from multiple print and digital sources, using search terms effectively; assess the credibility and accuracy of each
	source by applying discipline specific criteria used in the social sciences or sciences; and quote or paraphrase the data/accounts and conclusions
	of others while avoiding plagiarism and following a standard format for citation. (MS-LS4-5)
6-8.WHST.9	Draw evidence from informational texts to support analysis, reflection and research. (MS-LS1-5)
8.SL.5	Integrate digital media and/or visual displays in presentations to clarify information, strengthen claims and evidence, and add elements of
	interest to engage the audience. (MS-LS3-1),(MS-LS3-2)
Mathematics –	
MP.4	Model with mathematics. (MS-LS3-2)
NY-6.SP.2	Understand that a set of quantitative data collected to answer a statistical question has a distribution which can be described by its center,
	spread, and overall shape. (MS-LS1-4),(MS-LS1-5)
NY-6.SP.4	Display quantitative data in plots on a number line, including dot plots, and histograms. (MS-LS1-4),(MS-LS1-5)
NY-6.SP.5	Summarize quantitative data sets in relation to their context. (MS-LS3-2)

**MS. Weather and Climate** Students who demonstrate understanding can: MS-ESS2-5. Collect data to provide evidence for how the motions and complex interactions of air masses results in changes in weather conditions. [Clarification Statement: Emphasis is on how air flows from regions of high pressure to low pressure, the complex interactions at air mass boundaries, and the movements of air masses affect weather (defined by temperature, pressure, humidity, precipitation, and wind at a fixed location and time). Emphasis is on how weather can be predicted within probabilistic ranges. Data can be provided to students (such as weather maps, diagrams, and visualizations) or obtained through laboratory experiments (such as with condensation).] [Assessment Boundary: Assessment includes the application of weather data systems but does not include recalling the names of cloud types, weather symbols used on weather maps, the reported diagrams from weather stations, or the interrelationship of weather variables.] MS-ESS2-6. Develop and use a model to describe how unequal heating and rotation of Earth cause patterns of atmospheric and oceanic circulation that determine regional climates. [Clarification Statement: Emphasis is on how patterns vary by latitude, altitude, and geographic land distribution. Emphasis is on the sunlight-driven latitudinal banding causing differences in density that create convection currents in the atmosphere, the Coriolis effect, and resulting prevailing winds; emphasis of ocean circulation is on the transfer of heat by the global ocean convection cycle, which is constrained by the Coriolis effect and the coastlines of continents. Examples of models could include diagrams, maps and globes, or digital representations.] [Assessment Boundary: Assessment does not include the dynamics of the Coriolis effect.1 MS-ESS3-5. Ask questions to clarify evidence of the factors that have caused the rise in global temperatures over the past century. [Clarification Statement: Examples of factors could include human activities (such as fossil fuel combustion, cement production, and agricultural activity) and natural processes (such as changes in incoming solar radiation or volcanic activity). Examples of evidence could include tables, graphs, and maps of global and regional temperatures, atmospheric levels of gases such as carbon dioxide and methane, and the rates of human activities. Emphasis is on the major role that human activities play in causing the rise in global temperatures.] The performance expectations above were developed using the following elements from the NRC document A Framework for K-12 Science Education: Science and Engineering Practices **Disciplinary Core Ideas Crosscutting Concepts** Asking Questions and Defining Problems ESS2.C: The Roles of Water in Earth's Surface Processes Cause and Effect Asking questions and defining problems in 6-8 The complex patterns of the changes and the movement of water in Cause and effect relationships may builds on K-5 experiences and progresses to the atmosphere, determined by winds, landforms, and ocean be used to predict phenomena in specifying relationships between variables, and temperatures and currents, are major determinants of local weather natural or designed systems. (MSclarifying arguments and models patterns. New York State P-12 Science Learning Standards

		Structure and Properties of Matter				
	demonstrate understanding can:					
HS-PS1-1.		el to predict the relative properties of element	=			
	electrons in the outermost energy level of atoms. [Clarification Statement: Examples of properties that could be predicted from patterns could include reactivity of metals, types of bonds formed, numbers of bonds formed, and reactions with oxygen.] [Assessment Boundary: Assessment is limited to main group elements. Assessment does not include quantitative understanding of ionization energy beyond relative trends.]					
HS-PS1-3. Plan and conduct an investigation to gather evidence to compare the structure of substances at the						
пэ-гэт-э.		•				
	scale to infer the strength of electrical forces between particles. [Clarification Statement: Emphasis is on understanding the strengths of forces between particles in solids, liquids, and gases, not on naming specific intermolecular forces (such as dipole-dipole). Examples of particles could include ions, atoms, molecules, and network solids. Examples of bulk scale properties of substances could include the melting point and boiling point, vapor pressure, and surface tension.]					
HS-PS1-8. Develop models to illustrate the changes in the composition of the nucleus of the atom and the energy						
	released during the processes of qualitative models, such as pictures or diagram	<b>released during the processes of fission, fusion, and radioactive decay.</b> [Clarification Statement: Emphasis is on simple qualitative models, such as pictures or diagrams, and on the scale of energy released in nuclear processes relative to other kinds of transformations.] [Assessment Boundary: Assessment does not include quantitative calculation of energy released. Assessment is limited to alpha, beta, positron, and gamma				
HS-PS2-6.	Communicate scientific and tech	hnical information about why the particulate-	level structure is important in			
	<b>the functioning of designed materials.</b> * [Clarification Statement: Emphasis is on the attractive and repulsive forces that determine the functioning of the material. Examples could include why electrically conductive materials are often made of metal, flexible but durable materials are made up of long chained molecules, and pharmaceuticals are designed to interact with specific receptors.] [Assessment Boundary: Assessment is limited to provided particulate structures of specific designed materials.]					
HS-PS1-9	1 5	m that the combined gas law describes the re	lationships among volume.			
		a sample of an ideal gas. [Clarification Statement: Real				
	The relationships of the variables in the combin	ned gas law may be described both qualitatively and quantitatively.				
	to the relationships among the variables of the	combined gas law, not the gas law names, i.e. Boyle's Law.]				
HS-PS1-10		regarding the formation, properties and behave				
		properties could include colligative properties, degree of saturation, types could include solid-liquid, liquid-liquid, and gas-liquid solutic				
		ass] [Assessment Boundary: Assessment of colligative properties is				
	point elevation and freezing point depression.]

*Connection boxes updated as of September 2018

**HS. Chemical Reactions** Students who demonstrate understanding can: HS-PS1-2. Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties. [Clarification Statement: Examples of chemical reactions could include the reaction of sodium and chlorine, of carbon and oxygen, or of carbon and hydrogen.] [Assessment Boundary: Assessment is limited to chemical reactions involving main group elements and combustion reactions.1 HS-PS1-4. Develop a model to illustrate that the release or absorption of energy from a chemical reaction system depends upon the changes in total bond energy. [Clarification Statement: Emphasis is on the idea that a chemical reaction is a system that affects the energy change. Examples of models could include molecular-level drawings and diagrams of reactions, graphs showing the relative energies of reactants and products, and representations showing energy is conserved.] [Assessment Boundary: Assessment does not include calculating the total bond energy changes during a chemical reaction from the bond energies of reactants and products.] HS-PS1-5. Apply scientific principles and evidence to explain how the rate of a physical or chemical change is affected when conditions are varied. [Clarification Statement: Explanations should be based on three variables in collision theory: number of collisions per unit time, particle orientation on collision, and energy required to produce the change. Conditions that affect these three variables include temperature, pressure, nature of reactants, concentrations of reactants, mixing, particle size, surface area, and addition of a catalyst.] [Assessment Boundary: Assessment is limited to simple reactions in which there are only two reactants and to specifying the change in only one condition at a time.] HS-PS1-6. Refine the design of a chemical system by specifying a change in conditions that would produce increased amounts of products at equilibrium.\* [Clarification Statement: Emphasis is on the application of Le Chatelier's Principle and on refining designs of chemical reaction systems, including descriptions of the connection between changes made at the macroscopic level and what happens at the molecular level. Examples of designs could include different ways to increase product formation including adding reactants or removing products.] [Assessment Boundary: Assessment is limited to specifying the change in only one variable at a time. Assessment does not include calculating equilibrium constants and concentrations 1 HS-PS1-7. Use mathematical representations to support the claim that atoms, and therefore mass, are conserved during a chemical reaction. [Clarification Statement: Emphasis is on using mathematical ideas to communicate the proportional relationships between masses of atoms in the reactants and the products, and the translation of these relationships to the macroscopic scale using the mole as the conversion from the atomic to the macroscopic scale. Emphasis is on assessing students' use of mathematical thinking and not on memorization and rote application of problem-solving techniques.] [Assessment Boundary: Assessment does not include complex chemical reactions.] HS-PS1-11, Plan and conduct an investigation to compare properties and behaviors of acids and bases. [Clarification Statement: Examples of properties could include pH values (concentration), neutralization capability and conductivity. Observations of behaviors could include the effects on indicators, reactions with other substances, and efficacy in performing titrations.] [Assessment Boundary: Reactions are limited to Arrhenius and Bronsted-Lowry acid-base reactions.] HS-PS1-12. Use evidence to illustrate that some chemical reactions involve the transfer of electrons as an energy conversion occurs within a system. [Clarification Statement: Evidence could include half-reactions, net ionic equations, and electrochemical cells to illustrate the mechanism of electron transfer.] [Assessment Boundary: Assessment is limited to completing and/or balancing oxidation and reduction half-reactions. Energy conversions are limited to qualitative statements] The performance expectations above were developed using the following elements from the NRC document A Framework for K-12 Science Education: Science and Engineering Practices **Crosscutting Concepts** Disciplinary Core Ideas PS1.A: Structure and Properties of Matter Patterns **Developing and Using Models** The periodic table orders elements horizontally Different patterns may be observed Modeling in 9-12 builds on K-8 and progresses to using, synthesizing, and by the number of protons in the atom's nucleus at each of the scales at which a developing models to predict and show relationships among variables and places those with similar chemical properties system is studied and can provide between systems and their components in the natural and designed in columns. The repeating patterns of this table evidence for causality in worlds. explanations of phenomena. (HSreflect patterns of outer electron states. (HS-Develop a model based on evidence to illustrate the relationships PS1-2) (Note: This Disciplinary Core Idea is also PS1-2),(HS-PS1-5),(HS-PS1-11) between systems or between components of a system. (HS-PS1-4) addressed by HS-PS1-1.) **Energy and Matter Planning and Carrying Out Investigations** A stable molecule has less energy than the same The total amount of energy and Planning and carrying out investigations to answer questions or test set of atoms separated; one must provide at matter in closed systems is solutions to problems in 9-12 builds on K-8 experiences and progresses to conserved. \*The performance expectations marked with an asterisk integrate traditional science content with engineering through a Practice or Disciplinary Core Idea. The text in the "Disciplinary Core Ideas" section is reproduced verbatim from A Framework for K-12 Science Education: Practices, Cross-Cutting Concepts, and Core Ideas unless it is preceded by (NYSED).

	integrate information into the text selectively to maintain the flow of ideas, avoiding plagiarism and overreliance on any one source and following a
	standard format for citation. (HS-PS2-5)
11-12.WHST.7	Draw evidence from informational texts to support analysis, reflection, and research. (HS-PS2-1), (HS-PS2-5)
Mathematics –	
MP.2	Reason abstractly and quantitatively. (HS-PS2-1),(HS-PS2-2),(HS-PS2-4)
MP.4	Model with Mathematics. (HS-PS2-1),(HS-PS2-2),(HS-PS2-4)
AI-N.Q.1	Select quantities and use units as a way to: i) interpret and guide the solution of multi-step problems; ii) choose and interpret units consistently in formulas; and iii) choose and interpret the scale and the origin in graphs and data displays. (HS-PS2-1),(HS-PS2-2),(HS-PS2-4),(HS-PS2-5)
AI-N.Q.3	Choose a level of accuracy appropriate to limitations on measurement and context when reporting quantities. (HS-PS2-1),(HS-PS2-2),(HS-PS2-4),(HS-PS2-5)
ALSSE.1	Interpret expressions that represent a quantity in terms of its context. (HS-PS2-1),(HS-PS2-2)
AI.SSE.3	Choose and produce an equivalent form of an expression to reveal and explain properties of the quantity represented by the expression. (HS-PS2-1),(HS-PS2-2)
AI.CED.1	Create equations and inequalities in one variable to represent a real-world context. (HS-PS2-1),(HS-PS2-2)
AI.CED.2	Create equations and linear inequalities in two variables to represent a real-world context. (HS-PS2-1),(HS-PS2-2)
AI.CED.4	Rewrite formulas to highlight a quantity of interest, using the same reasoning as in solving equations. (HS-PS2-1),(HS-PS2-2)
AI-F.IF.7	Graph functions and show key features of the graph by hand and by using technology where appropriate. (HS-PS2-1)
AI-S.ID.1	Represent data with plots on the real number line (dot plots, histograms, and box plots). (HS-PS2-1)
*Connection boxes	updated as of September 2018

New York State P-12 Science Learning Standards						
		HS. Energy				
Students who	demonstrate understanding can:					
HS-PS3-1.	. Create a computational model to calculate the change in the energy of one component in a system when					
	the change in energy of the other component(s) and energy flows in and out of the system are known. [Clarification Statement: Emphasis is on explaining the meaning of mathematical expressions for energy, work, and power used in the model.] [Assessment Boundary: Assessment is limited to basic algebraic expressions or computations; to systems of two or three components; and to work, power, thermal energy, kinetic energy, potential energy, electrical energy and/or the energies in gravitational, magnetic, or electric fields.]					
HS-PS3-2.		rate that energy at the macroscopic scale can				
	combination of energy associated with the motions of particles (objects) and energy associated with the					
	relative position of particles (obj conversion of kinetic energy to thermal energy,	<b>jects).</b> [Clarification Statement: Examples of phenomena at the the energy stored due to position of an object above Earth, and the le diagrams, drawings, descriptions, and computer simulations.]	e macroscopic scale could include the

data sets for consistency, and the use of models to generate and analyze data.

Analyze data using tools, technologies, and/or models (e.g., computational, mathematical) in order to make valid and reliable scientific claims or determine an optimal design solution. (HS-PS3-6)

### Using Mathematics and Computational Thinking

Mathematical and computational thinking at the 9–12 level builds on K–8 and progresses to using algebraic thinking and analysis, a range of linear and nonlinear functions including trigonometric functions, exponentials and logarithms, and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions.

Create a computational model or simulation of a phenomenon, designed device, process, or system. (HS-PS3-1)

**Constructing Explanations and Designing** Solutions

- · Conservation of energy means that the total change of energy in any system is always equal to the total energy transferred into or out of the system. (HS-PS3-1)
- Mathematical expressions, which quantify how the stored energy in a system depends on its configuration (e.g. relative positions of charged particles, compression of a spring) and how kinetic energy depends on mass and speed, allow the concept of conservation of energy to be used to predict and describe system behavior. (HS-PS3-1)
- The availability of energy limits what can occur in any system. (HS-PS3-1)
- Uncontrolled systems always evolve toward more stable states- that is, toward more uniform energy distribution (e.g., water flows downhill, objects hotter than their surrounding environment cool down). (HS-PS3-4)
- (NYSED) Energy exists in many forms, and when these forms change, energy is conserved. (HS-PS3-

behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models. (HS-PS3-1)

### **Energy and Matter**

- Changes of energy and matter in a system can be described in terms of energy and matter flows into, out of, and within that system. (HS-PS3-3)
- Energy can be transferred between one place and another place, between objects and/or fields, or between systems. (HS-PS3-2),(HS-PS3-6)

 In sexual reproduction, chromosomes can sometimes swap sections during the process of meiosis (cell division), thereby creating new genetic combinations and thus more genetic variation. Although DNA replication is tightly regulated and remarkably accurate, errors do occur and result in mutations, which are also a source of genetic variation. (HS-LS3-2)

(NYSED) Environmental factors can cause mutations in

 ${}^{\mathsf{Page}}69$ 

genes. Only mutations in sex cells can be inherited. (HS-

		HS. Weather and Climate	
	nonstrate understanding can:		
HS. ESS2-4.	Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate. [Clarification Statement: Examples of the causes of climate change differ by timescale, over 1-10 years: large volcanic eruption, ocean circulation; 10-100s of years: changes in human activity, ocean circulation, solar output: 10-100s of thousands of years: changes to Earth's orbit and the orientation of its axis; and 10-100s of millions of years: long-term changes in atmospheric composition and plate tectonic movement.] [Assessment Boundary: Assessment of the results of changes in climate is limited to changes in surface temperatures, precipitation patterns, glacial ice volumes, sea levels, and biosphere distribution.]		
HS-ESS3-5.	Analyze geoscience data and the results from global climate models to make an evidence-based forecast of the current rate of global or regional climate change and associated future impacts to Earth systems. [Clarification Statement: Examples of evidence, for both data and climate model outputs, are for climate changes (such as precipitation and temperature) and their associated impacts (such as on sea level, glacial ice volumes, or atmosphere and ocean composition).] [Assessment Boundary: Assessment is limited to one example of a climate change and its associated impacts.]		
HS-ESS2-8.	Evaluate data and communicate information to explain how the movement and interactions of air masses result in changes in weather conditions. [Clarification Statement: Examples of evidence sources could include station models, surface weather maps, satellite images, radar, and accepted forecast models. Emphasis should focus on communicating how the uneven heating of Earth's surface and prevailing global winds drive the movement of air masses and their corresponding circulation patterns, the interaction of different air masses at frontal boundaries, and resulting weather phenomena.] [Assessment Boundary: Analysis is limited to surface weather maps and general weather patterns associated with high and low pressure systems.]

		HS. Human Sustainability	
Students who de	emonstrate understanding ca	n:	
HS-ESS3-1.	Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity. [Clarification Statement: Examples of key natural resources include access to fresh water (such as rivers, lakes, and groundwater), regions of fertile soils such as river deltas, and high concentrations of minerals and fossil fuels. Examples of natural hazards can be from interior processes (such as volcanic eruptions and earthquakes), surface processes (such as tsunamis, mass wasting and soil erosion), and severe weather (such as blizzards, hurricanes, tornadoes, floods, and droughts) Examples of the results of changes in climate that can affect populations or drive mass migrations include changes to sea level, regional patterns of temperature and precipitation, and the types of crops and livestock that can be raised.]		
HS-ESS3-2.			
	resources based on cost-benefit ratios.* [Clarification Statement: Emphasis is on the conservation, recycling, and research resources (such as minerals and metals) where possible, and on minimizing impacts where it is not. Examples include developing best practices for agricultural soil use, mining (for coal, tar sands, and oil shales), and pumping (for petroleum and natural gas). Science knowledge indicates what can happen in natural systems—not what should happen.]		
HS-ESS3-3.			mong management of natural
	resources, the sustainability of human populations, and biodiversity. [Clarification Statement: Examples of factors that affect the management of natural resources include costs of resource extraction and waste management, per-capita consumption, and the development of new technologies. Examples of factors that affect human sustainability include agricultural efficiency, levels of conservation, and urban planning.] [Assessment Boundary: Assessment for computational simulations is limited to using provided multi-parameter programs or constructing simplified spreadsheet calculations.]		
HS-ESS3-4.	Evaluate or refine a tect [Clarification Statement: Example biomass and species diversity, or a Examples for limiting future impac	hnological solution that reduces impacts of s of data on the impacts of human activities could include the d areal changes in land surface use (such as for urban development ts could range from local efforts (such as reducing, reusing, and global temperatures by making large changes to the atmosphe	quantities and types of pollutants released, changes to ent, agriculture and livestock, or surface mining). Ind recycling resources) to large-scale geoengineering
HS.ESS3-6.		presentation to illustrate the relationships	
	are the hydrosphere, atmosphere, increase in atmospheric carbon dic impacts on sea organism health ar	modified due to human activity.* [Clarification cryosphere, geosphere, and/or biosphere. An example of the f oxide results in an increase in photosynthetic biomass on land a nd marine populations.] [Assessment Boundary: Assessment d d results of scientific computational models.]	far-reaching impacts from a human activity is how an and an increase in ocean acidification, with resulting
